INTRODUCTION

SEARCH prepared this work plan at the request of Gulf Power for the proposed NTL Phase 2 Transmission Corridor Project (Project) in Leon, Jefferson, Madison, and Suwannee Counties, Florida. The Project consists of the construction of a proposed transmission line corridor approximately 88 miles in length and 100 feet in width. The eastern terminus of the proposed route is the west side of River Road, 0.7 miles east of the Suwannee River in Suwannee County. The western terminus is the Arvah B. Hopkins Power Plant in Tallahassee in Leon County.

The purpose of this document is to present the approach that SEARCH will employ to conduct a Phase I cultural resource assessment survey (CRAS) for the Project. The goal of the CRAS will be to identify cultural resources (archaeological sites, cemeteries, or historical structures, bridges, linear resources [e.g., roads, railroads, canals], districts, or landscapes) that may be affected by the Project. **Appendix A** includes maps showing the estimated zones of archaeological probability, as well as the locations of previously recorded archaeological sites within the Project corridor. **Appendix B** depicts the previously recorded aboveground cultural resources within the Project corridor, as well as parcels that contain unrecorded structures that are at least 50 years old.

AREA OF POTENTIAL EFFECTS

The Physical Area of Potential Effects (Physical APE) is defined as the entirety of the 100-foot (30-meter) wide corridor. The Visual APE is defined as a 100-meter (330-foot) buffer that extends from each side of the centerline for the entire length of the Project corridor. The archaeological survey will be limited to the Physical APE, while the architectural survey will include the Physical and Visual APEs.

STATE AND FEDERAL PERMITS

Archaeological investigations on State lands will require 1A-32 permits, and archaeological investigations on Federal lands will require an Archaeological Resources Protection Act (ARPA) or Antiquities Act permit. State lands within the Physical APE include Lake Talquin State Forest, the Twin Rivers State Forest, and the Capital Circle Office Complex Conservation Area, which is managed by State Parks. Additional State lands immediately adjacent to the Physical APE include the Hixtown Swamp Conservation Area, the Upper Aucilla Conservation Area, and St. Marks River Preserve State Park. Federal lands within the Physical APE include Apalachicola National Forest.

PROJECT AREA ENVIRONMENT

The Project corridor encompasses various environments, including forests, agricultural fields, suburban areas, and the south edge of the City of Tallahassee. Much of the corridor is adjacent to major and minor highways, including Interstate 10. The Project is located within the Ocala Uplift District within the Suwannee River Valley, Flats and Swamps, State Line Hills, and the Big Bend Karst subdistricts, as well as the Paleodelta Relic subdistrict of the Apalachicola Delta at its western terminus (Brooks 1981). Soils within the Physical APE range from very poorly drained to well drained. Major rivers that intersect the Physical APE include the St. Marks River, Aucilla River, and the Suwannee River; these are in addition to numerous other creeks, streams, swamps, and other water bodies.

RECORDS REVIEW

Background research included queries of the Florida Master Site File (FMSF) database, county property appraiser databases, and the National Bridge Inventory database, as well as a review of historic maps to identify previously recorded archaeological sites and historic resources, as well as potential resources of historic age that have not been recorded with the FMSF.

PREVIOUS ARCHAEOLOGICAL SURVEYS WITHIN THE PHYSICAL APE

A search radius of one mile was used to identify previous archaeological surveys and recorded archaeological sites, as shown on the maps in **Appendix A**. One hundred archaeological surveys (exclusive of county-wide inventories, architecture-only surveys, and cell tower surveys) were identified within a one-mile radius of the centerline (**Appendix C**). Of these, 37 surveys overlapped or intersected the Physical APE for the current Project.

These survey reports were reviewed in order to determine whether any portion of the current Physical APE could be excluded from further investigation based on the results of previous surveys. However, it was determined that the previous surveys did not meet current Florida Division of Historical Resources (FDHR) survey guidelines, did not include maps of sufficient detail in order to assess their coverage, or had only minimal overlap with the current Physical APE. Therefore, no portion of the current Physical APE has been excluded from the current field survey based on previous survey coverage.

PREVIOUSLY RECORDED ARCHAEOLOGICAL SITES WITHIN THE PHYSICAL APE

There are 300 previously recorded archaeological sites within one mile of the Project corridor, and 33 of these sites are within the Physical APE (**Appendix D**). Four of the sites within the

Physical APE have been evaluated by the State Historic Preservation Officer (SHPO) as eligible for listing in the National Register of Historic Places (NRHP), 13 have been evaluated as ineligible, and 16 have not been evaluated.

PREVIOUSLY RECORDED HISTORIC RESOURCES WITHIN THE PHYSICAL AND VISUAL APE

A review of the FMSF database indicates that there are eight previously recorded historic resources within the Physical APE and an additional eight historic resources within the Visual APE. These include nine structures, five linear resources, and two cemeteries. These are depicted on the maps in **Appendix B** and summarized in tabular format in **Appendix E**. One linear resource that intersects the Physical and Visual APEs, the Springhill Railroad Tram (8LE02025), is listed in the NRHP. Six of the previously recorded historic resources (five structures and one linear resource) have been previously evaluated as ineligible for listing in the NRHP by SHPO. The NRHP eligibility of the remaining nine historic resources has not been evaluated.

POTENTIAL UNRECORDED HISTORIC RESOURCES

County property records indicate that there are 125 parcels that intersect the Physical and Visual APEs that contain structures built at least 50 years ago. A review of recent aerial imagery indicates that there are 94 structures within these parcels that fall within either the Physical or Visual APE that have not been previously recorded with the FMSF. Of these, 22 structures are within the Physical APE and 72 are within the Visual APE. The maps in **Appendix B** identify these historic parcels and indicate which contain buildings within either the Physical or Visual APEs. Additional information is presented in tabular format in **Appendix F**.

The National Bridge Inventory was reviewed to identify bridges within the Physical or Visual APEs that have not been previously recorded with the FMSF. Two unrecorded bridges were identified: Bridge No. 540039 over the St. Mark's River is within the Physical APE, and Bridge No. 540046 over Caney Branch is within the Visual APE.

HISTORIC MAP REVIEW

General Land Office (GLO) plat maps from the nineteenth century were reviewed along with historic US Geological Survey (USGS) topographic maps in order to identify additional potential unrecorded historic resources. These are summarized in **Table 1**. The GLO maps indicate that the Physical APE intersects the Forbes land claim, several "Indian Trails," and the "Road Leading from St. Marks to Tallahassee." USGS topographic maps indicate the presence of several churches and schools as well as roads and railroads within the Physical and Visual APE.

Table 1. Historic Maps of the APE.

ARCHAEOLOGICAL SURVEY METHODS

The archaeological survey of the Physical APE will follow the guidelines outlined in FDHR's *Cultural Resource Management Standards & Operations Manual, Module Three: Guidelines for Use by Historic Preservation Professionals*. The survey will consist of pedestrian survey and shovel testing for the entire length of the Project corridor. The intervals between shovel tests will follow the FDHR guidelines and the probability model developed for this Project, described below.

ARCHAEOLOGICAL PROBABILITY MODEL

The Physical APE has been assessed as having areas of high probability, moderate probability, and low probability for the occurrence of archaeological sites. These zones are indicated on the

maps in **Appendix A**, and the criteria established for each, as well as the total linear distance of each zone within the Physical APE, are summarized in **Table 2**.

Table 2. Archaeological Probability Zone Criteria and Linear Distances within the Physical APE.

Probability Zone	Criteria	Linear Distance (mi)
High	Within 50 meters of any waterbody	5.5
Moderate	Greater than 50 meters from water on soils with a classification of somewhat poorly drained or better	62.9
Low	Greater than 50 meters from water on soils that are classified as poorly or very poorly drained	19.0
Total		87.4

The criteria used to define these probability zones are based on Geographic Information System (GIS) datasets, including US Department of Agricultural (USDA) Natural Resources Conservation Service (NRCS) soil data and hydrological data from the USGS and National Wetlands Inventory (NWI). Because the spatial resolution of these data is variable, the estimated probability zone boundaries will be subject to refinement based on observations made during the course of the field survey. Disturbances related to modern land use may also factor into the assessment of archaeological probability. Areas not surveyed according to the established model will be thoroughly documented through notes and photographs.

Factors that may lead to a decrease in the probability zone lengths include:

- Flooded conditions;
- Paved surfaces/modern construction;
- Fill sediments in excess of 100 centimeters depth;
- Slopes exceeding 15 percent; and
- Agricultural plow zones breaching the subsoil.

Likewise, factors that may lead to an increase in the probability zone lengths include:

- If archaeological sites or occurrences are identified in shovel tests or on the ground surface;
- If historic structural remains are encountered;
- If micro-environments characterized by a sudden change in vegetation or topography are encountered, such as hardwood hammocks; and
- If unmapped hydrological features such as springs or streams, including dry stream beds, are encountered.

SHOVEL TESTING

Shovel tests will be placed at intervals of 25 meters within high probability zones, 50 meters within moderate probability zones, and 100 meters within a minimum of 10 percent of the low

probability zones unless hindered by paved surfaces or inundation. Shovel tests will be 50 centimeters in diameter. They will be excavated in 10-centimeter levels to a maximum depth of 100 centimeters, unless the water table or impenetrable substrate is encountered. Excavated soil will be sifted through 6.4-millimeter (1/4-inch) screen and backfilled upon completion of the fieldwork. Artifacts recovered from the shovel tests will be retained for laboratory analysis. Soil descriptions (texture, color [Munsell]) will be documented on standard forms, and representative soil profiles will be photographed. Shovel test locations will be indicated on field maps and recorded via Global Positioning System (GPS).

DOCUMENTATION OF ARCHAEOLOGICAL SITES AND OCCURRENCES

Archaeological sites will be recorded where three or more artifacts are found (surface or subsurface) within a 30-meter radius. Artifact deposits that do not meet this threshold will be documented as archaeological occurrences (AOs). Archaeological sites and AOs will be documented and delineated in the same manner in the field, but AOs will not receive trinomials or FMSF forms.

Newly Recorded Sites

The boundaries of previously unrecorded archaeological sites and AOs will be delineated by at least two consecutive negative shovel tests placed at 12.5-meter intervals in each of the cardinal directions from the outer extent of positive shovel tests or surface artifacts. However, no site documentation will occur outside the limits of the Physical APE. A sketch map will be created showing positive and negative shovel tests, surface finds, the built environment, and environmental features that influence the delineation process. Site boundaries and features also will be documented via GPS.

Previously Recorded Sites

As noted above, there are 33 previously recorded archaeological sites within the Physical APE, 17 of which have received an NRHP eligibility evaluation of either eligible or ineligible from SHPO. These 17 sites will be excluded from systematic shovel testing unless artifacts are recovered from outside of their previously recorded boundary, in which case the site boundary will be updated through the same delineation procedures outlined above. The 16 previously recorded sites that have not been evaluated by SHPO for NRHP eligibility will be investigated by pedestrian survey and shovel testing at 25-meter intervals. The site boundaries will be delineated according to the methods presented above; however, in some cases, records of previous work at each site may be taken into account when defining the site boundary. The FMSF records and NRHP eligibility recommendations for each of the 33 previously recorded sites will be updated based on the findings of the current survey.

ARTIFACT ANALYSIS AND CURATION

Artifacts recovered during the field survey will be retained for laboratory analysis. These items will be labeled by provenience and transported to the SEARCH laboratory for processing and analysis. At the SEARCH laboratory, these items will be washed and dried and then analyzed using appropriate reference materials. This information will be recorded in a relational database with code numbers to allow systematic, comparable data entry. Aboriginal lithic artifacts will be analyzed by source material, method of manufacture, and artifact function. Aboriginal ceramics will be analyzed by temper, surface decoration, and vessel morphology. Historic non-aboriginal artifacts will be analyzed by use, material type, and function. The artifacts will be packaged in acid-free, 4-mil polyethylene bags with acid-free paper label inserts. Upon the conclusion of the Project, the artifacts will be returned to the appropriate landowners.

HUMAN REMAINS

If human remains are encountered during the field survey, the stipulation of Chapter 872.05, Florida Statutes, will be followed. Work in the vicinity will cease, and the appropriate State or local authorities will be notified.

ARCHITECTURAL HISTORY SURVEY METHODS

Non-archaeological historic resources (e.g., structures, linear resources, bridges, cemeteries, districts, landscapes) within the Physical or Visual APEs will be surveyed and documented following FDHR's *Cultural Resource Management Standards & Operations Manual, Module Three: Guidelines for Use by Historic Preservation Professionals*. Architectural features such as construction date, roof type, porches, number of stories, construction method, exterior walls, foundation, and significant architectural features will be recorded on standard forms. Photographs will include landscape and streetscape views. Previously recorded historic resources will be documented in the same manner as unrecorded resources, and previously unrecorded resources will be assigned a trinomial. Structures accompanied by multiple outbuildings, roadways, gardens, industrial/commercial facilities, etc. that appear to be 50 years old or older may be considered part of a historic district or landscape, which would require a separate trinomial and set of documentation.

EVALUATION OF SITE SIGNIFICANCE

Cultural resources identified within the survey area will be assessed for their potential for listing in the NRHP according to the criteria defined in 36 CFR 60.4. According to these established guidelines, significance is judged when sites, structures, or objects possess integrity of location, design, setting, materials, workmanship, feeling, and association, and:

- A. are associated with events that have made a significant contribution to the broad patterns of our history; or
- B. are associated with the lives of persons significant in our past; or
- C. embody the distinctive characteristics of a type, period, or method of construction, or possess high artistic values, or represent a significant and distinguishable entity whose components may lack individual distinctions; or
- D. have yielded, or may be likely to yield, information important in prehistory or history.

While most NRHP-eligible archaeological sites are significant under Criterion D, this criterion requires a level of clarification to illuminate the issue of site importance. As such, the following attribute evaluations add a measure of specificity that can be used in assessing site significance and NRHP eligibility:

- Site Integrity – Does the site contain intact cultural deposits, or is it disturbed?
- Preservation – Does the site contain material suited to in-depth analysis and/or absolute dating such as preserved features, botanical material, faunal remains, or human skeletal remains?
- Uniqueness – Is the information contained in the site redundant in comparison to that available from similar sites, or do the remains provide a unique or insightful perspective on research concerns of regional importance?
- Relevance to Current and Future Research – Would additional work at this site contribute to our knowledge of the past? Would preservation of the site protect valuable information for future studies? While this category is partly a summary of the above considerations, it also recognizes that a site may provide valuable information regardless of its integrity, preservation, or uniqueness.

REPORTING

Upon conclusion of the fieldwork, a technical report will be prepared in accordance with Rule Chapter 1A-46, F.A.C. The report will include an executive summary, Project introduction, environmental context, cultural and historical context, background research, a research design, and the survey results. The survey results will include a description and NRHP eligibility recommendation for each cultural resource documented within the Physical or Visual APEs, in accordance with the criteria outlined above.

SUMMARY AND CONCLUSION

This work plan has been prepared by SEARCH at the request of Gulf Power to serve as a basis for completing the cultural resource survey requirements for the proposed NTL Phase 2 Transmission Corridor Project in Leon, Jefferson, Madison, and Suwannee Counties, Florida.

The investigation will include an archaeological survey within the Physical APE for the Project, as well as an architectural history survey within the Physical and Visual APEs. The survey methods and documentation for previously recorded and newly recorded cultural resources will follow FDHR guidelines and the archaeological probability model described above. SEARCH anticipates that the archaeological survey will include 5.5 miles of high probability zones, 62.9 miles of moderate probability zones, and 19 miles of low probability zones, and will include updating 33 previously recorded archaeological sites within the Physical APE. The architectural history survey will include updating the 16 previously recorded historic resources (structures, linear resources, bridges, and cemeteries) and anticipates encountering up to 96 unrecorded resources identified through the records review summarized above.

The survey will result in a technical report that will include a description of the cultural resources documented within the Physical and Visual APEs, as well as a recommendation regarding the NRHP eligibility of each of these resources.
